Notice

<u>Oualified requesters</u>

Qualified requesters may obtain copies from the Defense Technical Information Center (DTIC), Cameron Station, Alexandria, Virginia 22314. Orders will be expedited if placed through the librarian or other person designated to request documents from DTIC.

Change of address

Organizations receiving reports from the U.S. Army Aeromedical Research Laboratory on automatic mailing lists should confirm correct address when corresponding about laboratory reports.

Disposition

Destroy this document when it is no longer needed. Do not return it to the originator.

Disclaimer

The views, opinions, and/or findings contained in this report are those of the author(s) and should not be construed s an official Department of the Army position, policy, or decision, unless so designated by other official documentation. Citation of trade names in this report does not constitute an official Department of the Army endorsement or approval of the use of such commercial items.

Introduction

The U.S. Army Aviation Epidemiology Data Register (AEDR) is a family of databases storing the medical history and physical findings of healthy and unhealthy Army aircrew members. AEDR researchers often need to know the number of aircrew members in a study cohort. This report presents age distribution reference tables for Army aviators stratified by gender, component, and calendar year for use by AEDR researchers and customers.

Methods

The AEDR flying duty medical examination (FDME) database was queried for the first FDME submitted each calendar year and Army aviator from 1986 through 1992. The aviator's age, gender, and component of service were cross-tabulated to produce frequency distribution tables with intervals of 1 and 5 years of age.

Results

Tables 1 through 7 show the age distribution for calendar years 1986 through 1992. These are stratified by age, gender, and component.

Discussion and summary

The absolute number of individual aviators has not been counted during this study. There is an annual turnover due to aviators entering by training and leaving after voluntary or involuntary separation. This is about 7 percent of the total force per year based on the number of new graduate aviators. Some aviators change from one component to another, and even back again to the original component. Retired aviators were temporarily called to active duty during Desert Storm. Some civilian aviators are dual-component. They serve as civilian aviators during the weekday and reserve component aviators during the weekend. Every effort was made to count them as civilian component, their principle duty, but this decreases the total number of reserve component aviators counted in each year.

In summary, these reference tables reflect the number of person-years (aviator-years) for calendar years 1986 to 1992, and not the absolute number of individuals in the cohort during all seven calendar years. AEDR researchers can use the tables to calculate annual incidence rates, annual period prevalence rates, and other rates based on aviator-years of occupational exposure stratified by age, gender, and/or component. Aeromedical resource, policy and standards, and safety managers can use the tables for planning and funding aviator preventive care programs.

Table 1. Age distribution of Army aviators for calendar year 1986.
